WASM = Engine Code + Unity Package + ThirdPart + GamePlay

- Engine Code Player Settings / Other Settings / Strip Engine Code
- GamePlay Player Settings / Other Settings / Managed Stripping Level
- Unity Package Built-in, In Project
- ThirdPart Assembly Define Platforms, Remove Unused File
- **C# Namespace** e.g. System.Threading
- **Shared Library** e.g. JSON (unity package + third part + wxsdk)
- **Design Patterns** Build Settings / Code Optimization : Runtime Speed

New Memory \approx Initial Memory Size * 120%

Memory Spikes \approx Initial Memory Size + New Memory

Memory size alignment multiples of 16

e.g:

- Initial Memory Size = 600M \Rightarrow 608M
- Memory Spikes** \approx 608M + 608M * 120%

建议值:

超休闲游戏: 256

中度游戏(模拟经营、卡牌成长): 496

重度游戏(SLG,MMO): 768

预留内存 = Max(Dynamic Memory) + 100M(+)

PART TWO

Transform and Optimization

UnityHeap Memory On WebGL

- Buffer Array, From Browser JS VM Heap
- Managed Heap allocated from the Unity Heap, never returned to the os system
- Managed Heap memory can only grow

PART TWO

Transform and Optimization

```
void ManagedAlloc(int sizeInMB)
{
    byte[] buf = new byte[sizeInMB * 1024 * 1024];
    buf = null;
}
```

PART TWO

Transform and Optimization

Garbage Collection On WebGL

1. in frame, no GC
2. GC.Collect() has no effect
3. frame end, minor GC
4. scene load, full GC

PART TWO

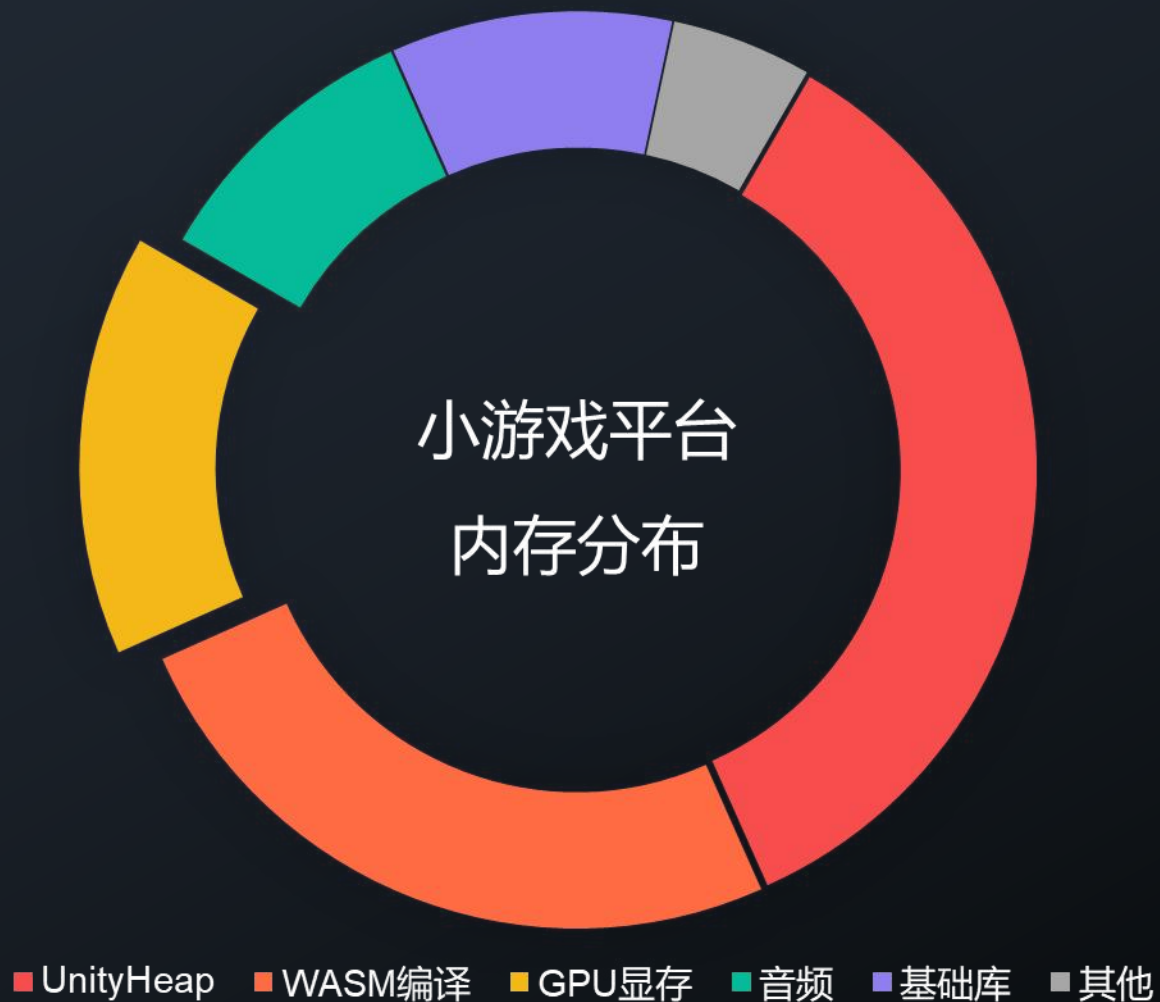

Transform and Optimization

- reasonable unityheap memory, no copy array buffer
- avoid memory fragment: managed memory, obj cache, boxing
- avoid big memory in frame: config file, assetbundle / assets, file system
- delegate, anonymous lambda, closure, coroutine, LINQ, reflection etc.
