

The Unity roadmap for games in 2023

An overview of new features
and tech planned for the coming year

What we will cover

→ **GAME FOCUS VISION**

→ **HOW TO SHAPE UNITY**

→ **RELEASE OVERVIEW**

→ **ROADMAP**

Rendering

Unity artistry

Expanded scale

Multiplayer

Platform reach

Empowering teams

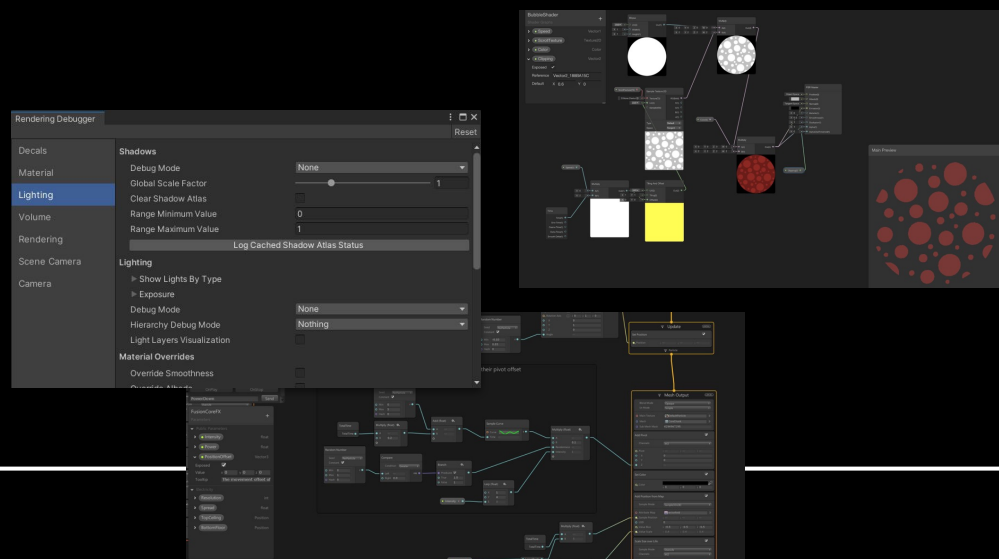

Rendering that scales with your needs

→ Scriptable Render Pipeline and graphics foundations

→ HDRP

→ URP

Scriptable Render Pipeline and graphics foundations

Cross-pipeline workflows and API

Universal Render Pipeline

2D and 3D, optimized for maximum platform reach and customizability

High Definition Render Pipeline

Off-the-shelf photorealistic 3D rendering on PC and Consoles

Scriptable Render Pipeline and graphics foundations

→ **Material Variants**

Fast authoring of materials at scale

→ **Full-screen master node**

Custom post process and full screen effects with Shader Graph

→ **VFX Graph improvements**

Build advanced effects that can be reused at scale

→ **Adaptive Probe Volumes**

Global illumination that scales with your needs with improved authoring workflows

→ **Unification**

Streamlined cross-platform content authoring using both URP and HDRP

 Visuals that scale

Material Variants

Fast authoring of materials at scale

→ Reusability

Build and reuse libraries of materials, override only needed properties

→ Safe and speedy iteration at scale

Visualize material hierarchy and lock properties to prevent mistakes

Shader Graph Full-screen master node

Custom full screen passes as a top level effect without code

→ **Custom Post-Processing**

Create effects such as night vision and color blindness filters

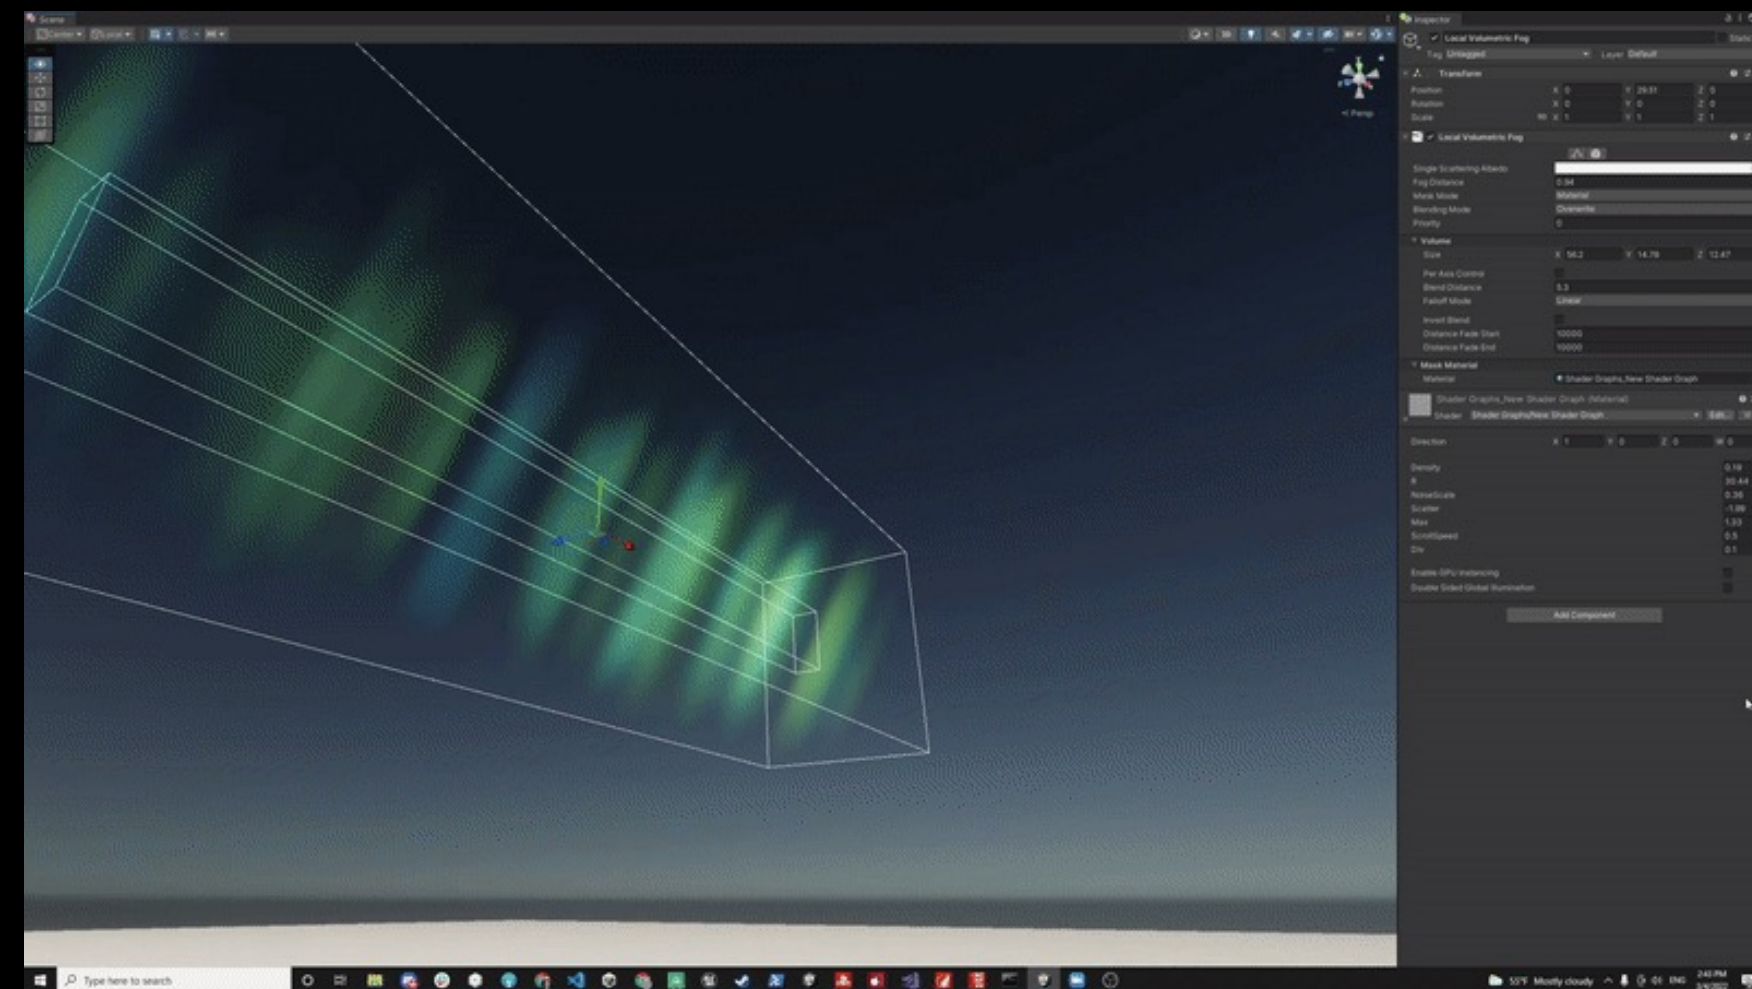

→ **Custom passes**

Create passes for edge detection and object highlights

→ **Custom render textures**

Procedural textures generation such as custom night HDRI and animated rain droplets

→ **Local Volumetric Fog (HDRP)**

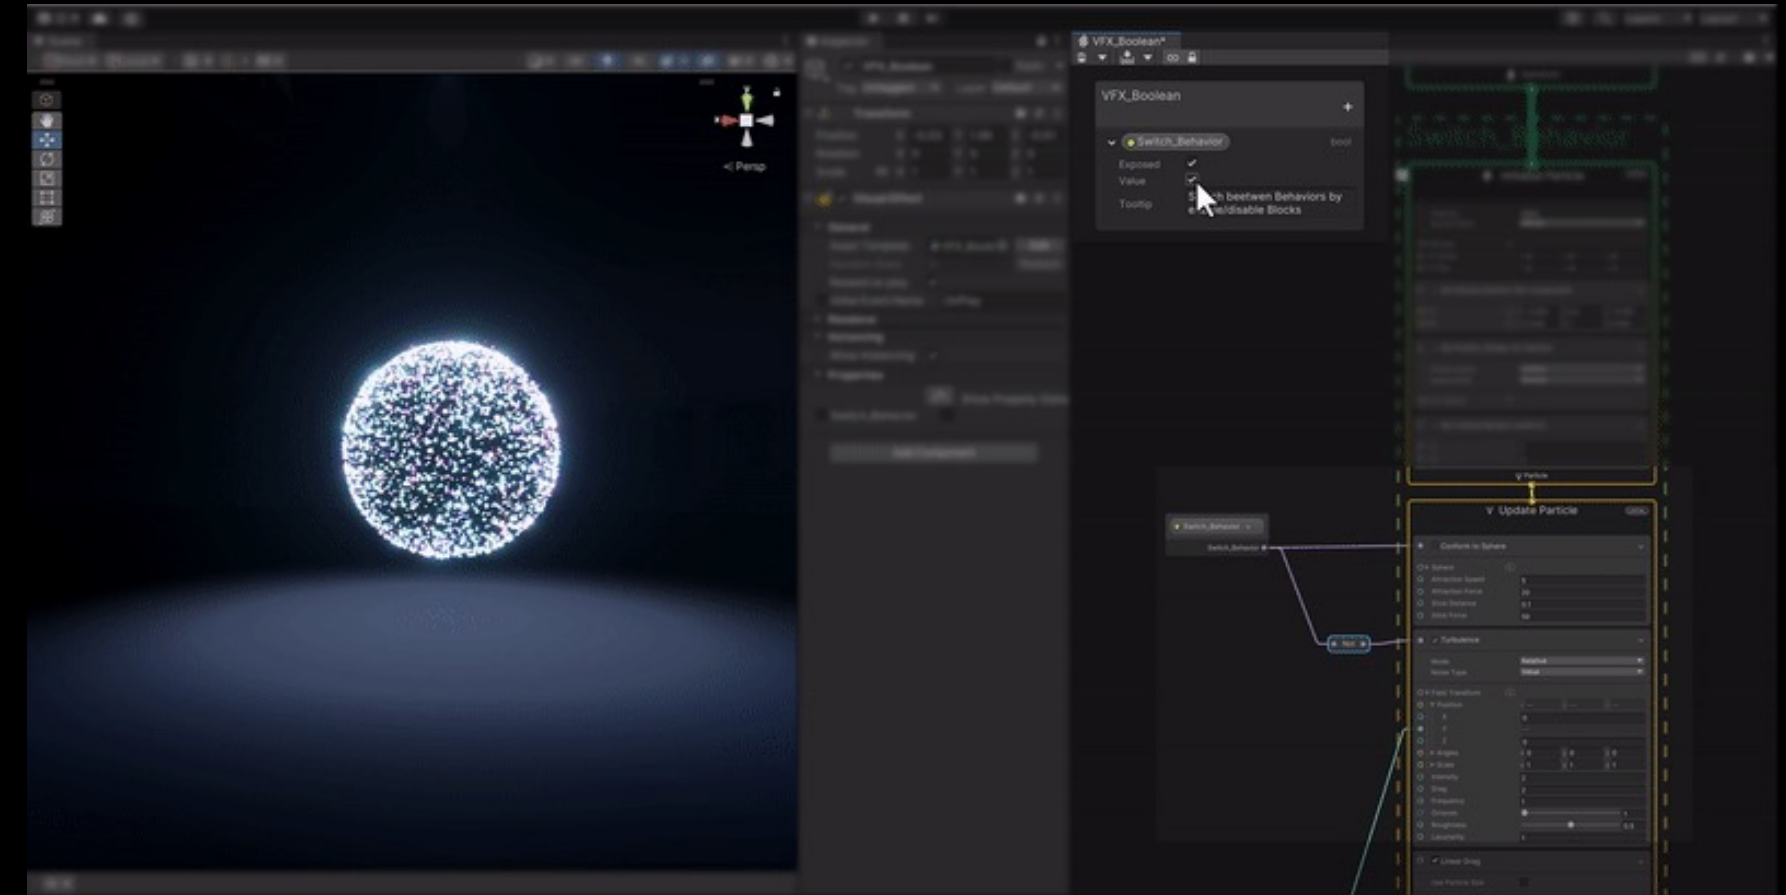

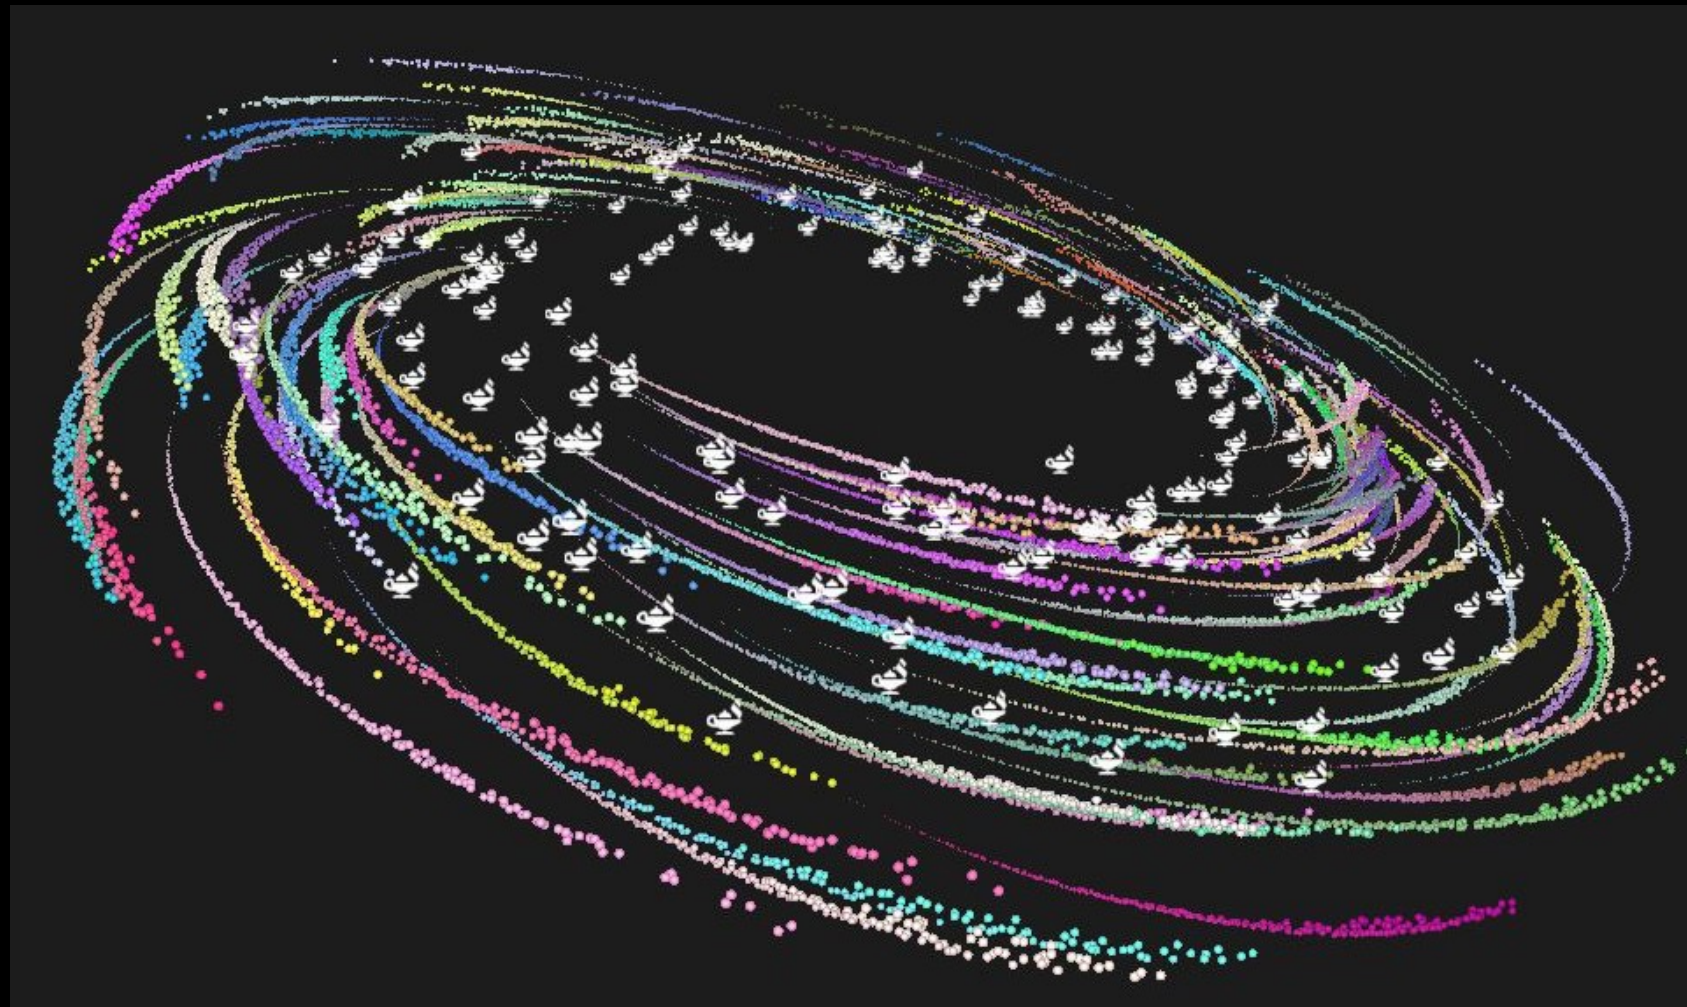

Custom procedural fog effects

VFX Graph

Build advanced effects that can be reused at scale

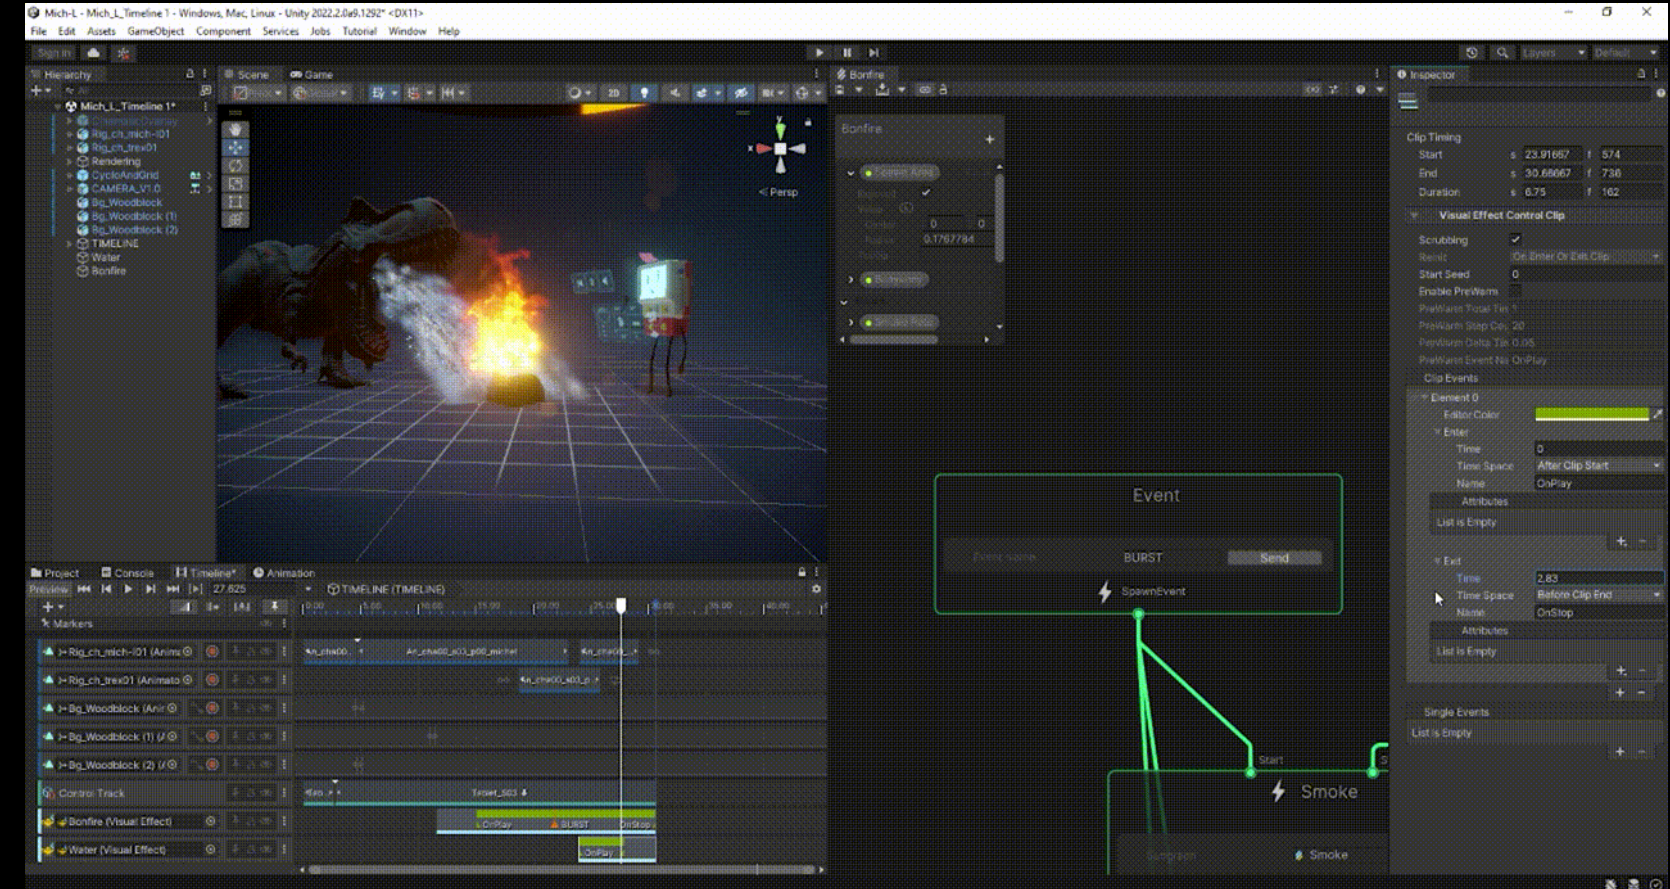

→ **Instancing**

Improve performance when reusing the same system

→ **Boolean ports**

Create configurable uber effects

→ **Six-way lighting (HDRP)**

Create better looking and more reusable smoke FX

→ **Timeline scrubbing**

Sequence complex effects or cinematics

Adaptive Probe Volumes

Simplified light probe placement tool, designed to increase iteration speed and improve visual quality

→ Adaptive Probe Volumes

Available in preview for HDRP in 2022.2

→ Visual quality

Light leaking prevention for static objects
Initial support for URP
Lighting scenario blending
Light probe data streaming
Volumetric fog influence (HDRP)

→ Additional GI improvements

Improved Screen Space GI (HDRP)
Path traced preview of baked GI in Editor
Light baking C# API

Unification

Streamlined cross-platform content authoring using both URP and HDRP

→ **SRP coexistence**

Ability to include URP and HDRP in the same project

Author and maintain different visual assets tailored to each pipeline

→ **Block shaders**

New intuitive syntax and unified shader authoring workflow across the rendering pipelines

Universal Render Pipeline

→ **Feature richness**

Built-in Renderer functionality you are familiar with

→ **Workflow improvements**

Greater customizability and more productive workflows

→ **Platform scalability**

Feature scalability across all Unity supported platforms

→ **Forward+ rendering path**

High-quality real-time lighting across a wide range of platforms

→ **LOD crossfade**

Smother transition blending between the current LOD and the next LOD

→ **Decal Layers**

High-quality real-time lighting across a wide range of platforms

→ **Temporal AA**

Supplements MSAA, FXAA, SMAA

High Definition Render Pipeline

→ **Production readiness**

Continuously improve quality, performance and customizability

→ **Physically based environments**

Rich and dynamic environments that react to time and weather changes

→ **Characters**

High-fidelity, playable humans and creatures

Physically based environments

Rich and dynamic environments that react to time and weather changes

→ **Water**

Oceans, rivers or pools that react to the wind and currents

→ **Sky**

Procedural clouds and sky that react to time, light, wind and weather changes

→ **Improved transparency and translucency**

Beautiful natural or manufactured objects

High-fidelity characters

High-fidelity playable humans and creatures

→ **Physical hair shading**

Realistic hair and fur shading and samples

→ **Hair and fur rasterizer**

Specialized hair renderer for high fidelity lighting and anti-aliasing

→ **Eyes**

High fidelity eyes with optional caustics and eye sample

→ **Improved Shadows**

Area lights high fidelity PCSS shadows, capsule shadows for large environments or cached shadows

Artist y tools

→ Character and
Creature Creation

→ Environments
and Vegetation

Serenity by Marc Schneider

Bringing Ziva to real-time

Ziva VFX

Advanced simulation helping artists replicate organic physics and biomechanics of muscles, fat, skin and cloth for photo-realistic character and creature assets

Ziva Real-time

Machine learning to adapt high-quality character simulations into real-time game engine assets, bridging the gap between film, real-time gaming and metaverse environments

Ziva Facetrainer

Accurate and scalable real-time face capture and playback technology supporting **ARKit** and markerless head-mounted camera performance capture

Vegetation pipeline

Breathing life into through industry-defining environment workflows and rendering

→ **Production-tested**

Environment authoring workflows powered by SpeedTree procedural modeling and new asset libraries

→ **Constantly improving**

Better workflows, performance, and rendering coming to the Unity Editor throughout 2023

→ **Industry-leading**

Adoption of Wētā vegetation and worldbuilding technology

SpeedTree environment tools

SpeedTree Modeler

SpeedTree 9.3 Q4 2022

- Convert photogrammetry to procedural trees instantly
- Unlock stylized modeling with Freehand sculpting
- Blend sculpted mesh details seamlessly with procedural geometry

SpeedTree + Unity

The latest SpeedTree tech

- Improved integration with HDRP and URP
- New wind techniques with less overhead and increased fidelity for AAA visuals and virtual production

SpeedTree Library

Ever-growing variety

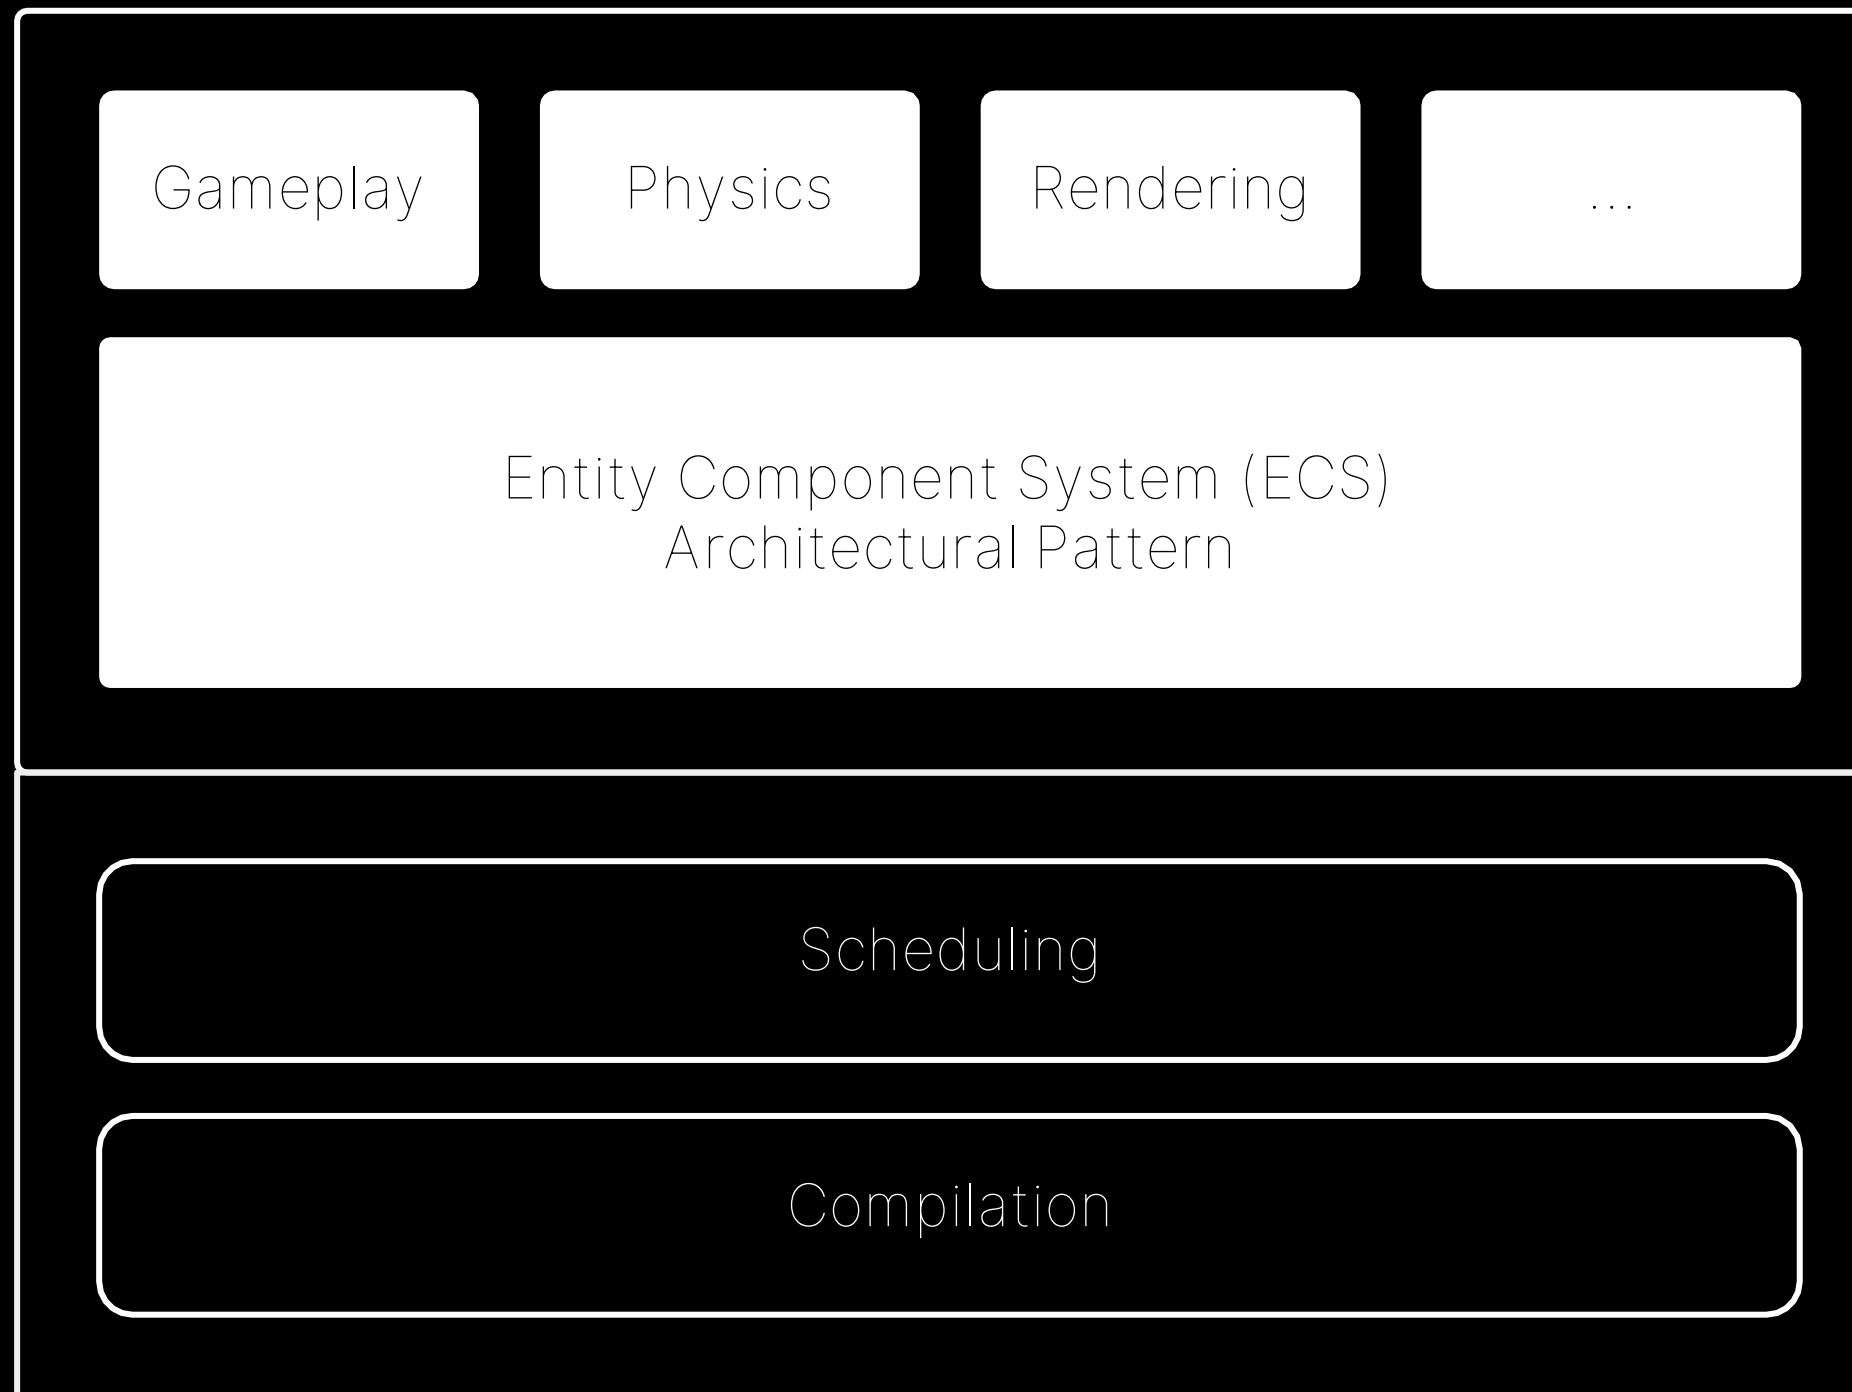

- Hundreds of new games models coming to the SpeedTree Store from around the world
- New photometry based materials, photogrammetry scans

Expanded scale for ambitious games

Data-Oriented Technology Stack (DOTS)

**Entities graphics,
Netcode for Entities, Unity Physics,
Havok Physics for Unity ...**

Entities package

C# Job System

Burst compiler

ECS support for production

Transition ECS from Experimental to being fully supported for production on all platforms

→ **Experimental Entities 0.50**

Reach ECS compatibility with 2020 LTS
Available since March 16, 2022

→ **Experimental Entities 0.51**

Reach ECS compatibility with 2021 LTS
Available since June 22, 2022

→ **Entities 1.0 Release**

Reach ECS compatibility with 2022.2 Tech Stream
An ECS foundation supported for use in production

ECS for Unity 2022

Enable seasoned Unity creators to build more ambitious games with a fully supported data-oriented foundation

Streamlined ECS workflows

Compatible with GameObjects

Flexible game architecture

Adapts well to gameplay changes

Control and determinism

New gameplay opportunities at scale

Best leverage the hardware resources

Optimize use of memory & CPU

Made for massive data streaming

Large scale scene and rendering

Unprecedented simulation scale

Unity Physics and Havok Physics for Unity

Large multiplayer games

Medium to large competitive action games

Upcoming ECS samples and tutorials

Megacity

Large-scale streaming

Subscene authoring workflows that scale well to thousands of entities with high-performance streaming capabilities

ECS Racing

Competitive multiplayer

Client/server architecture with client-side prediction, interpolation, and lag compensation

ECS tutorials

Reducing learning curve

Self-guided tutorials, videos and samples for users to learn and use ECS for Unity, including Entities, Collections, Burst, Mathematics, and C# Job System

What's next

Accelerate getting started with data-oriented development, and leveraging its benefits in high level creation workflows

→ Consolidation of data-oriented development

Acquisition of Rival character controller

→ Multiplayer foundation gaps

Cross-play determinism

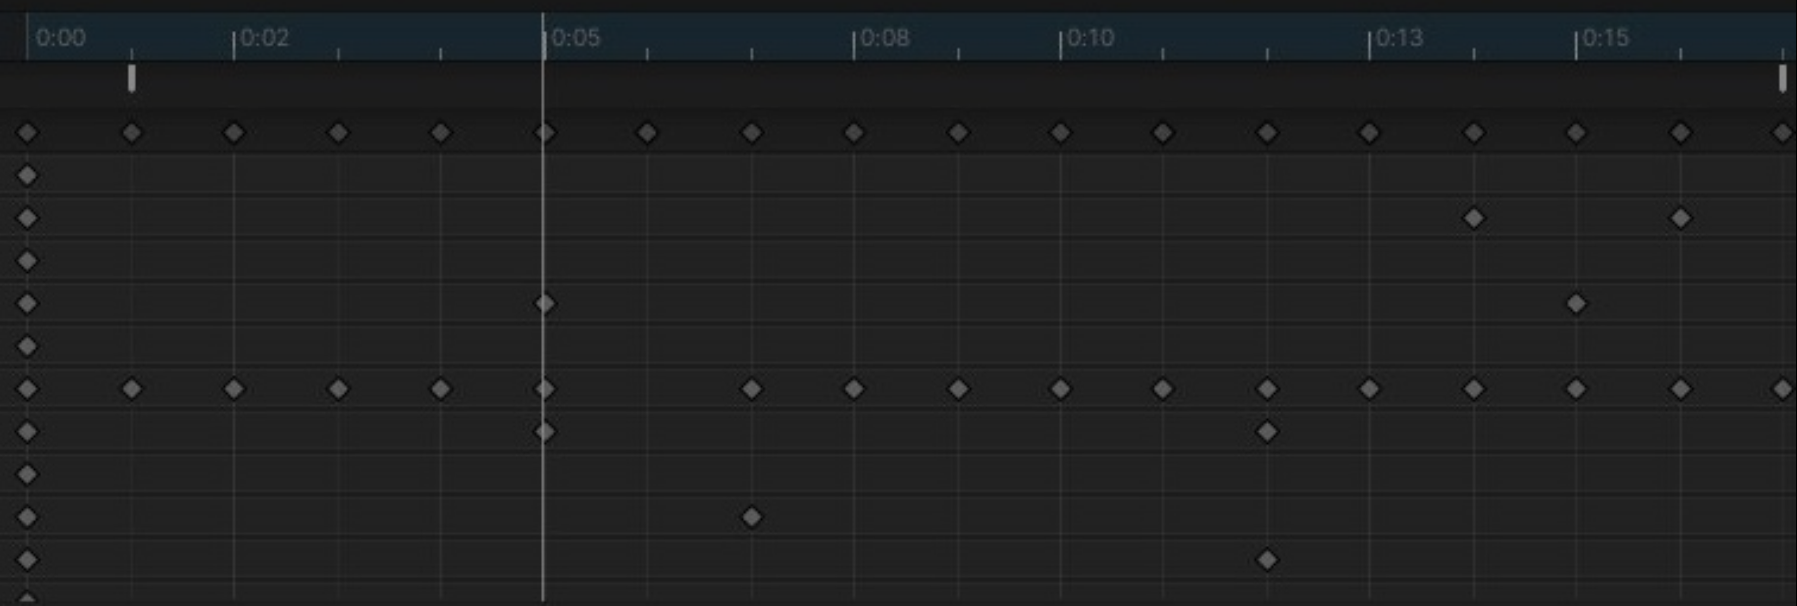

→ Open-world foundation gaps

Streaming, authoring scalability

Animation

Progressing toward a highly performant, extremely customizable, and accessible 3D animation system

→ **GameObjects and ECS**

Targeting all users and project types with GameObjects, and leveraging ECS performance benefits wherever possible

→ **Mecanim**

Focusing on stability and performance and continuously delivering and backporting fixes

Worldbuilding

Integrated environment authoring workflows to help you build organic 3D worlds

→ Spline authoring

Create tools to draw geometry
Branch, merge, extrude

→ Environment workflows

Overlays for terrain
Scattering improvements
Detail density

Isolation View
Exit

Maximizing your platform reach

→ Mobile

→ Web

→ Desktop and console

→ XR

Mobile

Tools that enable performant and beautiful games across an expansive ecosystem of devices

→ **Fast deploy for Android**

Improving iteration time on device, by only updating what has changed

→ **Android configuration manager**

Easily manage your configuration files inside the Unity Editor

→ **Game activity for Android**

Bringing support for the GameActivity API from Google

→ **Toolchain updates**

for Android and iOS to ensure compatibility with the latest devices

Desktop and console

Specialized solutions that unlock the full potential of the hardware to push the limits of fidelity and game design

→ **DX12 out of preview**

DX12 out of preview in 2022.2 for significant performance and stability improvements across Editor and Player

→ **Ray tracing**

Xbox Series support introduced in 2022.2
Ray Tracing out of experimental in 2023.1

→ **Incremental builds**

Coming to all supported console platforms this year.

→ **ChromeOS build and run**

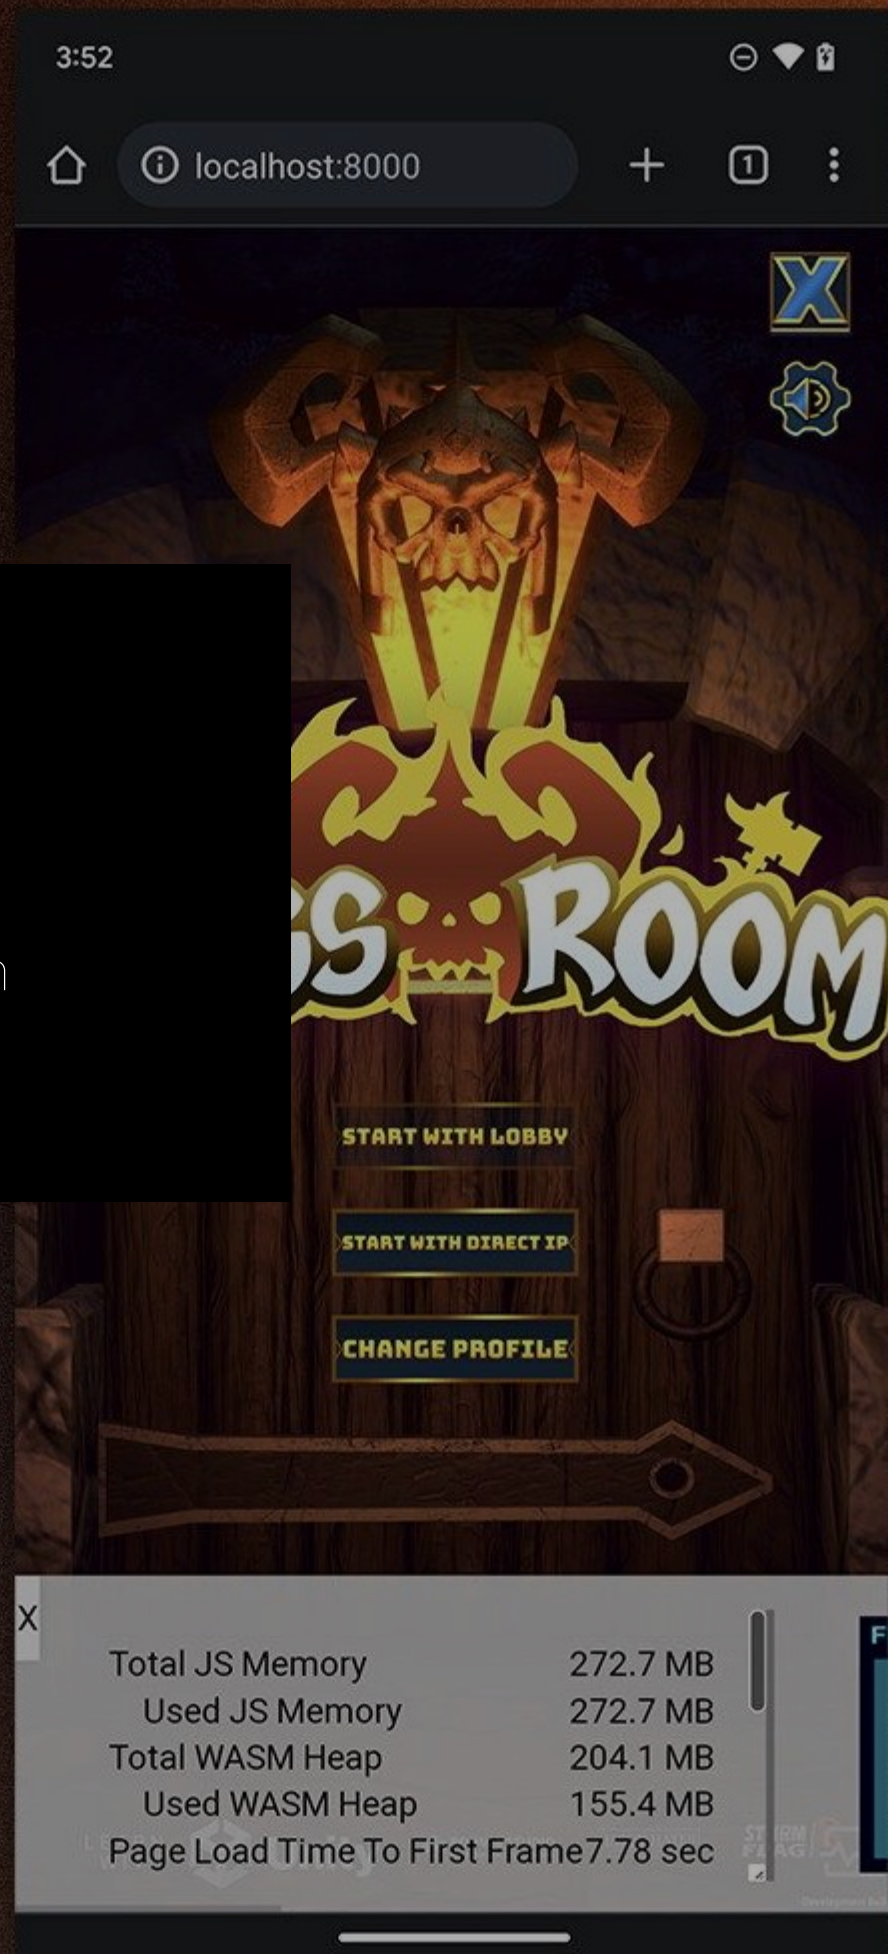

Quick deploy to ChromeOS over Wifi

→ **Arm support for Windows**

Native ARM64 support for windows standalone player coming in 2023.1

Web

Expand the reach of your content

→ Mobile browser support

Touch/keyboard support
Mobile texture compression

→ WebGL memory management

New player setting for fine grained control over memory usage and a new diagnostic overlay to measure performance

→ Tool chain updates

Updates to Emscripten 3.1.8 toolchain

→ WebGL multithreading

Support for native (C++) multithreading

 Industry Customer & Partner Portfolio

And more...

Mercedes-Benz

“We’ve adopted radical software driven approach to the UI/UX. For the first time, we’ve used a game engine to elevate the UI to the next level of digital luxury.”

In doing so, we partner with [Unity Technologies](#), whose products are the basis of at least half of the mobile games, augmented realities since 2018. Their experience is evident, [the visuals are like nothing you’ve ever seen in the car industry!](#)”

Magnus Östberg
Chief Software Officer at Mercedes-Benz AG
